### Abstract

The notion of the paper has to investigate new set named as nano  $g^*b$ -closed sets ( $Ng^*b$ ) in nano topological spaces (NTS). Some important results of  $Ng^*b$ -closed sets are analysed. Also, we examine the relationship of  $Ng^*b$ -closed sets with other sets in NTS.

**Keywords:** Nanog $^*b$ -closed, nanobclosure.

### 1. Introduction

The idea of  $g$ -closed sets in TS was first investigated by Levine. Andrijevic initiated and studied  $b$ -open sets. Vidhya discussed the studied the  $g^*b$ -closed set in TS. Lellis Thivagar introduced a NTS in which he examined the terms of higher & lower approximation, boundary region.  $N_{open}$ ,  $N_{closed}$ ,  $N_{interior}$  and  $N_{closure}$  of a set are the elements of NTS. In this article, we introduced a new set on NTS called  $Ng^*b$ -closed sets and analyzed the association of  $Ng^*b$ -closed set with other sets. From the beginning to end of this paper  $(P, \tau)$  and  $(Q, \sigma)$  express the non-empty TS.

### II. Preliminaries

**Definition 2.1:** "Consider  $\mathcal{U}$  be a non-empty finite set of objects called the universe and be an equivalence relation on  $\mathcal{U}$  named as the indiscernibility relation. Thus  $\mathcal{U}$  is divided into disjoint equivalence classes. Elements belonging to the same equivalence class are indiscernible with one another. The pair  $(\mathcal{U}, R)$  are called approximation space". Let  $P \subseteq \mathcal{U}$ .

1. "The lower approximation of  $P$  with respect to  $R$  is the set of all objects, which classified as  $P$  with

The Paper Presented at 14th International Conference on Intelligent System and Control (ISCO'20)  
Organized by The Department of Computer Science and Engineering, Karpagam College of  
Engineering, Coimbatore, India

respect to R and given as  $\mathcal{L}_R(P)$ .

$$\mathcal{L}_R(P) = \bigcup_{p \in U} \{R(p) : R(p) \subseteq P\}$$

where  $R(p)$  represents the equivalence class determined by  $p$ ”.

2. “The upper approximation of P with respect to R is the set of all objects, which classified as P with

respect to R and given as  $\mathcal{U}_R(P)$ .

$$\mathcal{U}_R(P) = \bigcup_{p \in U} \{R(p) : R(p) \cap P \neq \emptyset\}$$

3. “The boundary region of P with respect to R is the set of all objects, which classifies neither as P

nor as notP with respect to R and it is given as  $B_R(P)$ .

$$B_R(P) = \mathcal{U}_R(P) - \mathcal{L}_R(P)$$

**Property 2.2** “Consider  $P, Q \subseteq U$  and  $(U, R)$  is an approximation space, then

$$(a) \mathcal{L}_R(P) \subseteq P \subseteq \mathcal{U}_R(P)$$

$$(b) \mathcal{L}_R(\emptyset) = \mathcal{U}_R(\emptyset) = \emptyset \text{ and } \mathcal{L}_R(U) = \mathcal{U}_R(U) = U$$

$$(c) \mathcal{U}_R(P \cup Q) = \mathcal{U}_R(P) \cup \mathcal{U}_R(Q)$$

$$(d) \mathcal{U}_R(P \cap Q) \subseteq \mathcal{U}_R(P) \cap \mathcal{U}_R(Q)$$

$$(e) \mathcal{L}_R(P \cup Q) \supseteq \mathcal{L}_R(P) \cup \mathcal{L}_R(Q)$$

$$(f) \mathcal{L}_R(P \cap Q) = \mathcal{L}_R(P) \cap \mathcal{L}_R(Q)$$

$$(g) \mathcal{L}_R(P) \subseteq \mathcal{L}_R(Q) \text{ and } \mathcal{U}_R(P) \subseteq \mathcal{U}_R(Q) \text{ whenever } P \subseteq Q$$

$$(h) \mathcal{U}_R(P^c) = [\mathcal{L}_R(P)]^c \text{ and } \mathcal{L}_R(P^c) = [\mathcal{U}_R(P)]^c$$

$$(i) \mathcal{U}_R \mathcal{U}_R(P) = \mathcal{L}_R \mathcal{U}_R(P) = \mathcal{U}_R(P)$$

$$(j) \mathcal{L}_R \mathcal{L}_R(P) = \mathcal{U}_R \mathcal{L}_R(P) = \mathcal{L}_R(P)$$

**Definition 2.3** “Let  $U$  be the universe, R be an equivalence relation on  $U$  and  $\tau_R(P) = \{U, \emptyset, \mathcal{L}_R(P), \mathcal{U}_R(P), B_R(P)\}$  where  $P \subseteq U$  Then  $\tau_R(P)$  satisfies the following three axioms

1.  $U$  and  $\emptyset \in \tau_R(P)$

2. The union of the elements of any subcollection of  $\tau_R(P)$  is in  $\tau_R(P)$

3. The intersection of the elements of any finite subcollection of  $\tau_R(P)$  is in  $\tau_R(P)$ ”.

Thus  $\tau_R(P)$  is considered as topology on  $U$  called the NT on  $U$  with reference to P. Therefore  $(U, \tau_R(P))$  is the NTS. The elements of  $\tau_R(P)$  are Nopen sets and the complement of Nopen are Nclosed sets.

**Remark 2.4[VI]** The set  $B = \{\mathcal{U}, \mathcal{L}_R(P), B_R(P)\}$  is called as basis of  $\tau_R(P)$ , where  $\tau_R(P)$  is the NT on  $\mathcal{U}$  considering P.

**Definition 2.5[VI]** Consider  $(\mathcal{U}, \tau_R(P))$  is a NTS with reference to P, where  $P \subseteq \mathcal{U}$  and  $C \subseteq \mathcal{U}$ , then

(i) The union of every Nopen subsets contained in C which is represented as  $Nint(C)$  is known as the Ninterior of the set C.

(ii) The intersection of every Nclosed subsets containing C which is represented as  $Ncl(C)$  is known as the Nclosure of C.

**Definition 2.6** Consider  $(\mathcal{U}, \tau_R(P))$  be a NTS and  $C \subseteq \mathcal{U}$ . Thus C is called as

- (i) Nsemiopen if  $C \subseteq Ncl(Nint(C))$
- (ii) Npreopen if  $C \subseteq Nint(Ncl(C))$
- (iii) Nregularopen if  $C = Nint(Ncl(C))$
- (iv) Nsemi preopen if  $C \subseteq Ncl(Nint(Ncl(C)))$
- (v) Nbopen if  $C \subseteq Ncl(Nint(C)) \cup Nint(Ncl(C))$

**Definition 2.7** Let  $(\mathcal{U}, \tau_R(P))$  be a NTS and  $C \subseteq \mathcal{U}$ . Then C is said to be Nsemi-closed (Nregular closed, Npre-closed, Nclosed, Nsemi pre-closed, Nb-closed respectively) if its complement is Nsemi-open (Nregular open, Npre-open, Nopen, Nsemi pre-open, Nb-open respectively)

**Definition 2.8** Let  $(\mathcal{U}, \tau_R(P))$  be a NTS and  $C \subseteq \mathcal{U}$ . Thus C is called as

- (i) Ngclosed if  $Ncl(C) \subseteq S$  whenever  $C \subseteq S$  and S is Nopen in  $\mathcal{U}$ .
- (ii) Nwgclosed if  $Ncl(Nint(C)) \subseteq S$  whenever  $C \subseteq S$  and S is Nopen in  $\mathcal{U}$ .
- (iii) Ngpclosed if  $Npcl(C) \subseteq S$  whenever  $C \subseteq S$  and S is Nopen in  $\mathcal{U}$ .
- (iv) Ngpreclosed if  $Npcl(C) \subseteq S$  whenever  $C \subseteq S$  and S is Nregularopen in  $\mathcal{U}$ .
- (v) Ngbclosed if  $Nbcl(C) \subseteq S$  whenever  $C \subseteq S$  and S is Nopen in  $\mathcal{U}$ .

### III. Nano g\*b-Closed Sets

**Definition 3.1:** A subset C of NTS  $(\mathcal{U}, \tau_R(P))$  is known as “nanogeneralized star bclosed” (briefly, Ng\*bclosed), if  $Nbcl(C) \subseteq S$  whenever  $C \subseteq S$  where S is Ngopen in  $\mathcal{U}$ .

**Theorem 3.2:** Every Nclosed set is Ng\*bclosed.

**Proof:** Here C be a Nclosed set in  $\mathcal{U}$ , S is Ng-open in  $\mathcal{U} \Rightarrow C \subseteq S, Nbcl(C) = C \subseteq S$ .

Thus we obtain  $Nbcl(C) \subseteq S$ . Therefore Nclosed set C is Ng\*bclosed set in  $\mathcal{U}$ .

**Remark 3.3:** The next example explains that converse part of theorem 3.2 may not be true.

*Copyright reserved © J. Mech. Cont. & Math. Sci. Vidhya. D et al.*

**Example 3.4:** Consider  $\mathcal{U} = \{e, f, g, h\}$  with  $\mathcal{U}/R = \{\{e\}, \{g\}, \{f, h\}\}$  and  $P = \{e, f\} \subseteq \mathcal{U}$ . Finally nano topology is defined as  $\tau_R(P) = \{\mathcal{U}, \phi, \{e\}, \{f, h\}, \{e, f, h\}\}$ . Hence  $C = \{e\}$  is  $\text{Ng}^*\text{bclosed}$  set and not  $\text{Nclosed}$ .

**Remark 3.5:** The proof of the theorems 3.6 and 3.9 can be proved similarly as theorem 3.2.

**Theorem 3.6:** Let  $(\mathcal{U}, \tau_R(P))$  be a NTS and  $C \subseteq S$ , then

- (i) Every  $\text{Nregularclosed}$  is  $\text{Ng}^*\text{bclosed}$ .
- (ii) Every  $\text{Nsemiclosed}$  is  $\text{Ng}^*\text{bclosed}$ .
- (iii) Every  $\text{Naclosed}$  is  $\text{Ng}^*\text{bclosed}$ .
- (iv) Every  $\text{Npreclosed}$  is  $\text{Ng}^*\text{bclosed}$ .
- (v) Every  $\text{Ngclosed}$  is  $\text{Ng}^*\text{bclosed}$ .
- (vi) Every  $\text{Ngpclosed}$  is  $\text{Ng}^*\text{bclosed}$ .
- (vii) Every  $\text{Ngpclosed}$  is  $\text{Ng}^*\text{bclosed}$ .

**Remark 3.7:** The next example explains that converse part of theorem 3.6 may not be true.

**Example 3.8:** Consider  $\mathcal{U} = \{\alpha, \beta, \gamma, \delta\}$  with  $\mathcal{U}/R = \{\{\alpha\}, \{\gamma\}, \{\beta, \delta\}\}$  and  $P = \{\alpha, \beta\} \subseteq \mathcal{U}$ . Hence NT is given as  $\tau_R(P) = \{\mathcal{U}, \phi, \{\alpha\}, \{\beta, \delta\}, \{\alpha, \beta, \delta\}\}$ . Therefore  $\{\beta\}$  and  $\{\delta\}$  are  $\text{Ng}^*\text{bclosed}$  sets but not  $\text{Nregularclosed}$  and  $\text{Nsemiclosed}$  sets. Also the set  $\{\beta, \delta\}$  is  $\text{Ng}^*\text{bclosed}$  set but not  $\text{Nclosed}$  and  $\text{Npreclosed}$  set. Hence the set  $\{\alpha\}$  is  $\text{Ng}^*\text{bclosed}$  set but not  $\text{Ngclosed}$  and  $\text{Ngpclosed}$  set. Also the set  $\{\gamma\}$  is  $\text{Ng}^*\text{bclosed}$  but not  $\text{Ngpclosed}$ .

**Theorem 3.9:** Consider  $(\mathcal{U}, \tau_R(P))$  be a NTS and  $C \subseteq S$ , then every  $\text{Ng}^*\text{bclosed}$  set is  $\text{Nwgclosed}$ ,  $\text{Ngbclosed}$  and  $\text{Nsemipreclosed}$ .

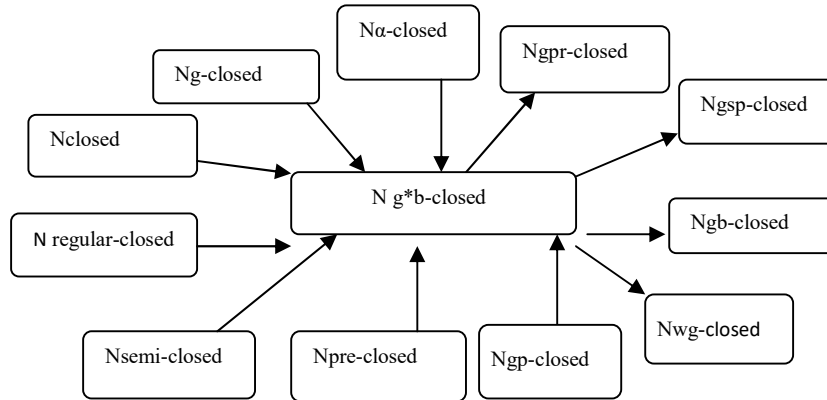

**Remark 3.10:** The following examples 3.11, 3.12 and 3.13 describes the converse part of the above theorem 3.9.

**Example 3.11:** Considering  $\mathcal{U} = \{e, f, g, h\}$  along with  $\mathcal{U}/R = \{\{e\}, \{g\}, \{f, h\}\}$  and  $P = \{e, f\} \subseteq \mathcal{U}$ . Hence we obtain NT as  $\tau_R(P) = \{\mathcal{U}, \phi, \{e\}, \{f, h\}, \{e, f, h\}\}$ . Hence the set  $\{e, f, h\}$  is  $\text{Nwgclosed}$  set but not  $\text{Ng}^*\text{bclosed}$ .

**Example 3.12:** Considering  $\mathcal{U} = \{\alpha, \beta, \gamma\}$  along with  $\mathcal{U}/R = \{\{\alpha\}, \{\beta, \gamma\}\}$  and  $P = \{\alpha\} \subseteq \mathcal{U}$ . Hence we obtain nano topology as  $\tau_R(P) = \{\mathcal{U}, \phi, \{\alpha\}\}$ . Finally the sets  $\{\alpha, \beta\}$  and  $\{\delta\}$  are  $\text{Ngbclosed}$  sets and not  $\text{Ng}^*\text{bclosed}$  set.

**Example 3.13:** Considering  $\mathcal{U} = \{\alpha, \beta, \gamma, \delta\}$  along with  $\mathcal{U}/R = \{\{\alpha\}, \{\gamma\}, \{\beta, \delta\}\}$  and  $P = \{\alpha, \beta\} \subseteq \mathcal{U}$ . Hence we obtain nano topology as  $\tau_R(P) = \{\mathcal{U}, \phi, \{\alpha\}, \{\beta, \delta\}, \{\alpha, \beta, \delta\}\}$ . Therefore the set  $\{\alpha, \beta\}$  is  $\text{Nsemipreclosed}$  and not  $\text{Ng}^*\text{bclosed}$ .

**Corollary 3.14:** Thus we conclude that none of the implications are reversible.

**Remark 3.15:** If  $M$  and  $N$  are  $Ng^*b$ -closed in  $\mathcal{U}$ , then union of  $M$  and  $N$  is not  $Ng^*b$ -closed in  $\mathcal{U}$ .

**Example 3.16:** The proof for the above remark is given below.

Consider  $\mathcal{U} = \{\alpha, \beta, \gamma, \delta\}$  with  $\mathcal{U}/R = \{\{\alpha\}, \{\gamma\}, \{\beta, \delta\}\}$  and  $P = \{\alpha, \beta\} \subseteq \mathcal{U}$ . Thus  $\tau_R(P) = \{\mathcal{U}, \phi, \{\alpha\}, \{\beta, \delta\}, \{\alpha, \beta, \delta\}\}$ . The  $Ng^*b$ -closed sets in  $\mathcal{U}$  are  $\mathcal{U}, \phi, \{\alpha\}, \{\beta\}, \{\gamma\}, \{\delta\}, \{\alpha, \gamma\}, \{\beta, \gamma\}, \{\beta, \delta\}, \{\gamma, \delta\}, \{\alpha, \beta, \gamma\}, \{\alpha, \gamma, \delta\}$  and  $\{\beta, \gamma, \delta\}$ . If  $M = \{\alpha\}$  and  $N = \{\beta\}$ , then  $M$  and  $N$  are  $Ng^*b$ -closed but  $M \cup N = \{\alpha, \beta\}$  is not  $Ng^*b$ -closed in  $\mathcal{U}$ .

**Theorem 3.17:** If  $K$  and  $L$  are two  $Ng^*b$ -closed subsets, then  $K \cap L$  is  $Ng^*b$ -closed.

**Proof:** Here  $K$  and  $L$  be the two  $Ng^*b$ -closed subsets in  $\mathcal{U} \ni K \subseteq S$  and  $L \subseteq S$  is  $Ng$ -open in  $\mathcal{U}$  and so  $K \cap L \subseteq S$ . As  $K$  and  $L$  are  $Ng^*b$ -closed, we get  $K \subseteq Nbcl(K)$  &  $L \subseteq Nbcl(L)$ , finally  $K \cap L \subseteq Nbcl(K) \cap Nbcl(L) \subseteq Nbcl(K \cap L)$ . Thus  $K \cap L$  is a  $Ng^*b$ -closed set in  $(\mathcal{U}, \tau_R(P))$ .

**Theorem 3.18:** Suppose  $C$  is a  $Ng^*b$ -closed subset of  $\mathcal{U} \ni C \subseteq D \subseteq Nbcl(C)$ , then  $D$  is  $Ng^*b$ -closed.

**Proof:** Here  $S$  be a  $Ng$ -open set of  $\mathcal{U} \ni D \subseteq S$ , then  $C \subseteq S$ . Since  $C$  is  $Ng^*b$ -closed, we have  $Nbcl(C) \subseteq S$ . Hence  $Nbcl(C) \subseteq Nbcl(Nbcl(C)) = Nbcl(C) \subseteq S$ . Thus  $D$  is  $Ng^*b$ -closed.

**Theorem 3.19:** A subset  $C$  of  $\mathcal{U}$  is  $Ng^*b$ -closed if and only if  $Nbcl(C) - C$  has no non-empty  $Ng$ -closed set.

**Proof:**

**Necessary part:** Consider  $D$  be a  $Ng$ -closed set of  $\mathcal{U} \ni D \subseteq Nbcl(C) - C$ . The  $C \subseteq \mathcal{U} - D$ . Since  $C$  is  $Ng^*b$ -closed and  $\mathcal{U} - D$  is  $Ng$ -open the  $Nbcl(C) \subseteq \mathcal{U} - D$ . This gives  $D \subseteq \mathcal{U} - Nbcl(C)$ . So  $D \subseteq (\mathcal{U} - Nbcl(C)) \cap (Nbcl(C) - C) \subseteq (\mathcal{U} - Nbcl(C)) \cap Nbcl(C) = \phi$ .

*Copyright reserved © J. Mech. Cont.& Math. Sci. Vidhya. D et al.*

**Sufficient part:** Consider  $Nbcl(C)$  -  $C$  has no non-empty  $Ng$ -closed set. Here  $C \subseteq S$ , where  $S$  is open. If  $Nbcl(C) \not\subseteq S$ , then  $Nbcl(C) \cap S^c$  is a non-empty  $Ng$ -closed set of  $Nbcl(C) - C$ , contradicts the result. Thus  $Nbcl(C) \subseteq S$ , where  $S$  is  $Ng^*$ -closed.

**Corollary 3.20:** If  $D$  be a  $Ng$ -closed set and  $C$  be  $Ng^*$ -closed, then  $C \cap D$  is  $g^*$ -closed set which have been proved below.

**Example 3.21:** Let  $U = \{e, f, g\}$  along with  $U/R = \{\{e\}, \{f, g\}\}$  &  $P = \{e\} \subseteq U$ . Therefore  $\tau_R(P) = \{U, \phi, \{\alpha\}\}$  and  $\tau_R^c(P) = \{U, \phi, \{\beta, \gamma\}\}$ . Therefore  $Ng^*$ -closed =  $\{U, \phi, \{\beta\}, \{\gamma\}, \{\beta, \gamma\}\}$ . If we take  $C = \{f\}$  &  $D = \{f, g\}$ , then  $C \cap D$  will be a  $Ng^*$ -closed set.

#### IV. Conclusion

Finally, we had constructed a set called  $Ng^*$ -closed and studied some of its basic properties.
