(Received: November 8, 2021; Accepted: January 3, 2022)

Abstract

A modified extended iteration procedure is applied to compute the analytical periodic solutions of the nonlinear oscillator having fractional terms. A nonlinear oscillator with $u^{1/3}$ force is given to demonstrate the effectiveness and expediency of the iteration scheme. Mickens' extended iteration method is a well-established method for studying random oscillations. The method is also simple and straightforward to accomplish approximate frequency and the corresponding periodic solution of the strongly nonlinear oscillator. The method gives high validity for both small and large initial amplitudes of oscillations. We have used an appropriate truncation of the obtained Fourier cosine series in each step of iterations to determine the approximate analytic solution of the oscillators. The second, third, and fourth approximate frequencies of the truly nonlinear oscillator with $u^{1/3}$ force show a good agreement with their exact values. Also, we have compared the calculated results with some of the existing results. We have shown that the method performs reasonably better.

Keywords: Mickens' Extended iteration procedure; Nonlinear oscillator with the fractional term; Nonlinearity; Fourier series.

I. Introduction

Nonlinear oscillations are a significant expression of dynamic behavior met in various fields. Every dynamic system displays oscillations of some kind. The most intuitional and evident nonlinear oscillations are in the field of engineering, but they are also regularly met in other fields, such as electromagnetism, logistics (stock), economy (business cycles), biology (population cycles), etc. The exact mathematical description and characterization of nonlinear oscillations are therefore of great importance in science, engineering, medical science, economics, etc. So studies on

M. M. Ayub Hossain et al

nonlinear oscillations system are most attractive of researchers. Although research on non-linear systems is a lot complex and sensitive because the characteristic of the non-linear system unexpectedly changes due to some small deviation of existing parameters as well as time. A lot of analytical methods are established to solve nonlinear oscillators such as Perturbation Method [XXX, XXXI]; Homotopy Perturbation Method [III]; He's Homotopy Perturbation Method [IV, V]; Harmonic Balance Method [VI, XXIV-XXVI]; Iterative Method [I, XI-XXII, XXVII-XXIX]; Cubication Method [IX]; He's Max-Min Method [II], Rational Energy Balance Method [VII]; Energy Balance Method [XXIII], He's Energy Balance Method [VIII, X], etc. Among them, Mickens' extended iteration method is one of the most extensively utilized methods in which the nonlinear term is strong. Mickens has developed an extended iteration technique and further effort has been through by Lim, Hu, Wu, and Haque.

The core point of this paper is to solve approximately the nonlinear oscillator with the fractional term by using Mickens' extended iteration method and to compare the output obtained with the exact one and with the result obtained by He's energy balance method (HEBM) [X] to the oscillator. As we can see, the results presented in this paper reveal that the Mickens extended iteration method is very efficient and competent for the nonlinear oscillator with the fractional term.

II. The methodology

There are three steps in the iterative process:

- (i) Considering a second-order ordinary differential equation
- (ii) Constructing it into standard form
- (iii) Taking iterative scheme

(i) Consider the second-order nonlinear differential equation of the form

$$F(\ddot{u}, u) = 0 \text{ with } u(0) = a, \dot{u}(0) = 0 \quad (1)$$

Equation (1) rewritten of the form

$$\ddot{u} + f(u) = 0 \quad (2)$$

(ii) Now the iteration form of equation (2) is

$$\ddot{u} + \omega^2 u = \omega^2 u - f(u) = H(u, \omega) \quad (3)$$

where ω is the natural frequency and currently ω^2 as well as ω is unknown.

(iii) The Iterative scheme of equation (3) is of the form

$$\ddot{u}_{k+1} + \omega_k^2 u_{k+1} = H(u_k, \omega_k); k = 0, 1, 2, \dots \quad (4)$$

$$u(t) = a \cos(\omega t), \quad (5)$$

And

$$u_{k+1}(0) = a, \dot{u}_{k+1}(0) = 0, \quad (6)$$

where a is the amplitude of the oscillator.

The extended iteration scheme is of the form

$$\ddot{u}_{k+1} + \omega_k^2 u_{k+1} = H(u_k, \ddot{u}_k) + H_u(u_0, \omega_k)(u_k - u_0) \quad (7)$$

where $H_u = \frac{\partial H}{\partial u}$ And u_{k+1} satisfies the conditions (6)

$u_1(t)$, $u_2(t)$, $u_3(t)$ and ω_0 , ω_1 , ω_2 are the first, second, third, approximate roots and corresponding frequencies of the oscillators respectively obtained by avoiding the secular terms in each step of iteration.

III. Solution Procedure

We consider an $u^{1/3}$ force nonlinear oscillator as

$$\ddot{u} + \varepsilon u^{1/3} = 0. \quad (8)$$

Adding $\omega^2 u$ on both sides of equation (8), we get

$$\ddot{u} + \omega^2 u = \omega^2 u - \varepsilon u^{1/3} = H(u, \omega^2) \quad (9)$$

$$\text{where } H(u, \omega^2) = \omega^2 u - \varepsilon u^{1/3} \quad (10)$$

$$\text{Therefore } H_u = \omega^2 - \frac{1}{3} \varepsilon u^{-2/3} \quad (11)$$

According to our consideration, the extended scheme of equation (7) will be

$$\ddot{u}_{k+1} + \omega_k^2 u_{k+1} = (\omega_k^2 u_0 - \varepsilon u_0^{1/3}) + (\omega_k^2 - \frac{1}{3} \varepsilon u_0^{-2/3})(u_k - u_0) \quad (12)$$

To obtain first iterated result, we have

$$\ddot{u}_1 + \omega_0^2 u_1 = \omega_0^2 a \cos \theta - \varepsilon (a \cos \theta)^{1/3} \quad (13)$$

M. M. Ayub Hossain et al

After expanding the equation (13) reduces to

$$\begin{aligned}\ddot{u}_1 + \omega_0^2 u_1 = & (\omega_0^2 a - 1.1595952670 \varepsilon a^{\frac{1}{3}}) \cos \theta \\ & + 0.2319190534 \varepsilon a^{\frac{1}{3}} \cos 3\theta - 0.1159595267 \varepsilon a^{\frac{1}{3}} \cos 5\theta\end{aligned}\quad (14)$$

To avoid secular terms from equation (14), we obtain

$$\Omega_0 = \frac{1.0768450525^{\frac{1}{2}}}{a^{\frac{1}{3}}}.$$
(15)

Ω_0 indicates the first approximate frequency of the oscillator.

After removing secular terms, the equation (14) changes to

$$\ddot{u}_1 + \omega_0^2 u_1 = 0.2319190534 \varepsilon a^{\frac{1}{3}} \cos 3\theta - 0.1159595267 \varepsilon a^{\frac{1}{3}} \cos 5\theta \quad (16)$$

The solution of equation (16) is

$$\begin{aligned}u_1(t) = & C \cos \theta + a(-0.0250000000 \cos 3\theta \\ & + 0.0041666667 \cos 5\theta)\end{aligned}\quad (17)$$

Using $u_1(0) = a$, we have $C = 1.020833333a$

Therefore,

$$\begin{aligned}u_1(t) = & a(1.020833333 \cos \theta - 0.0250000000 \cos 3\theta \\ & + 0.0041666667 \cos 5\theta)\end{aligned}\quad (18)$$

This $u_1(t)$ represents the first approximate analytical solution of the oscillator.

For the second level, we have

$$\ddot{u}_2 + \omega_1^2 u_2 = (\omega_1^2 u_0 - u_0^{\frac{1}{3}}) + (\omega_1^2 - \frac{1}{3} u_0^{\frac{-2}{3}})(u_1 - u_0). \quad (19)$$

$$\text{That is } \ddot{u}_2 + \omega_1^2 u_2 = \omega_1^2 u_1 - \frac{1}{3} \varepsilon u_0^{\frac{-2}{3}} u_1 - \frac{2}{3} \varepsilon u_0^{\frac{1}{3}}. \quad (20)$$

After expanding the equation (20) reduces to

$$\begin{aligned}\ddot{u}_2 + \omega_1^2 u_2 = & (1.0208333333a\omega_1^2 - 1.1697417255\varepsilon a^{\frac{1}{3}})\cos\theta \\ & + (-0.0250000000a\omega_1^2 + 0.2466775386\varepsilon a^{\frac{1}{3}})\cos 3\theta \\ & + (0.0041666667a\omega_1^2 - 0.1225481362\varepsilon a^{\frac{1}{3}})\cos 5\theta\end{aligned}\quad (21)$$

To avoid secular terms from equation (21), we obtain

$$\text{i.e. } \omega_1 = \frac{1.0704529160\varepsilon^{\frac{1}{2}}}{a^{\frac{1}{3}}}\quad (22)$$

Ω_1 indicates the second approximate frequency of the oscillator.

Then equation (21) yield

$$\ddot{u}_2 + \omega_1^2 u_2 = 0.2180308025\varepsilon a^{\frac{1}{3}}\cos 3\theta - 0.1177736801\varepsilon a^{\frac{1}{3}}\cos 5\theta\quad (23)$$

This $u_1(t)$ represents the first approximate analytical solution of the oscillator.

The solution of (23) is

$$\begin{aligned}u_2(t) = C_1 \cos\theta + a(-0.0237844289\cos 3\theta \\ + 0.0042825443\cos 5\theta)\end{aligned}\quad (24)$$

Using $u_2(0) = a$, we have $C_1 = 1.0195018846a$

Therefore,

$$\begin{aligned}u_2(t) = a(1.0195018846\cos\theta - 0.0237844289\cos 3\theta \\ + 0.0042825443\cos 5\theta)\end{aligned}\quad (25)$$

This is the second approximate analytical solution of the oscillator.

For the third level, we have

$$\ddot{u}_3 + \omega_2^2 u_2 = \omega_2^2 u_2 - \frac{1}{3}\varepsilon u_0^{-\frac{2}{3}} u_2 - \frac{2}{3}\varepsilon u_0^{\frac{1}{3}}.\quad (26)$$

By expanding, we have

$$\begin{aligned}\ddot{u}_3 + \omega_2^2 u_3 = & (1.0195018846a\omega_2^2 - 1.1691375861\varepsilon a^{\frac{1}{3}})\cos\theta \\ & - (0.0237844289a\omega_2^2 - 0.2459800828\varepsilon a^{\frac{1}{3}})\cos 3\theta \\ & + (0.0042825443a\omega_2^2 - 0.1223889282\varepsilon a^{\frac{1}{3}})\cos 5\theta\end{aligned}\quad (27)$$

M. M. Ayub Hossain et al

To avoid secular terms from equation (27), we obtain

$$\omega_2 = \frac{1.070875036 \varepsilon^{\frac{1}{2}}}{a^{\frac{1}{3}}} \quad (28)$$

This is the third approximate frequency of the oscillator.

Then equation (27) becomes

$$\begin{aligned} \ddot{u}_3 + \omega_2^2 u_3 = & 0.2187047337 \varepsilon a^{\frac{1}{3}} \cos 3\theta \\ & - 0.1174778205 \varepsilon a^{\frac{1}{3}} \cos 5\theta \end{aligned} \quad (29)$$

The solution of equation (29) is

$$\begin{aligned} u_3(t) = C_2 \cos \theta + a(-0.0238391412 \cos 3\theta \\ + 0.0042684190 \cos 5\theta) \end{aligned} \quad (30)$$

Using $u_3(0) = a$, we have $C_2 = 1.0195707222a$

Therefore,

$$\begin{aligned} u_3(t) = a(1.0195707222 \cos \theta - 0.0238391412 \cos 3\theta \\ + 0.0042684190 \cos 5\theta) \end{aligned} \quad (31)$$

This $u_3(t)$ indicates the third approximate analytical solution of the oscillator.

Proceeding to the fourth level $x_4(t)$ satisfies the equation

$$\ddot{u}_4 + \omega_3^2 u_4 = \omega_3^2 u_3 - \frac{1}{3} \varepsilon u_0^{-\frac{2}{3}} u_3 - \frac{2}{3} \varepsilon u_0^{\frac{1}{3}}. \quad (32)$$

By expanding, the equation (33) reduces to

$$\begin{aligned} \ddot{u}_4 + \omega_3^2 u_4 = & (1.0195707222a\omega_3^2 - 1.169167626 \varepsilon a^{\frac{1}{3}}) \cos \theta \\ & - (0.0238391412a\omega_3^2 - 0.2460109113 \varepsilon a^{\frac{1}{3}}) \cos 3\theta \\ & + (0.0042684190a\omega_3^2 - 0.1223915856 \varepsilon a^{\frac{1}{3}}) \cos 5\theta \end{aligned} \quad (33)$$

To avoid secular terms from equation (33), we obtain

$$\omega_3 = \frac{1.0708526428 \varepsilon^{\frac{1}{2}}}{a^{\frac{1}{3}}} \quad (34)$$

Which is the fourth approximate frequency of the oscillator.

IV. Results and discussions

To obtain approximate solutions of a nonlinear oscillator with $u^{1/3}$ force, we have applied an extended iteration method. Here we have calculated first, second, third, and fourth approximate frequencies ω_0 , ω_1 , ω_2 and ω_3 . The frequency-amplitude relationships are given in Table-1, Table-2, Table-3, and Table-4. To show the validity of the obtained solutions we have compared the results with the existing results determined by He's energy balance method [10]. The comparison between the third-order approximate solution of equation (8) for $\varepsilon = 0.1$ & $a = 10$, $\varepsilon = 1.0$ & $a = 10$, $\varepsilon = 0.1$ & $a = 10$ and $\varepsilon = 0.1$ & $a = 10$ together with corresponding exact solutions are presented in Figure-1, Figure-2, Figure-3, and Figure-4. Analyzing the results, we see that in our proposed method, the relative errors are less for all values of amplitude for the existing He's energy balance method and the values of frequencies are very proximate to exact values.

Note: Here $\omega_{[X]}^{HEBM}$ represents the approximation frequency obtained by Ganji S. S. *et al* [X].

Fig1. A comparison between the third-order approximate solutions of $\ddot{u} + \varepsilon u^{\frac{1}{3}} = 0$ when $\varepsilon = 0.1$ and $a = 10$ together with the corresponding exact solution.

Fig2. A comparison between the third-order approximate solutions of $\ddot{u} + \varepsilon u^{\frac{1}{3}} = 0$ when $\varepsilon = 1.0$ and $a = 10$ together with the corresponding exact solution.

Fig 3. A comparison between the third-order approximate solution of $\ddot{u} + \varepsilon u^{\frac{1}{3}} = 0$ when $\varepsilon = 10$ and $a = 10$ together with the corresponding exact solution.

Fig 4. A comparison between the third-order approximate solution of $\ddot{u} + \varepsilon u^{\frac{1}{3}} = 0$ when $\varepsilon = 100$ and $a = 10$ together with the corresponding exact solution.

V. Conclusion

We used a very easy but efficient method for the nonlinear oscillator. It can be observed that the second, third, and fourth approximations of the nonlinear oscillator provide almost the exact result. The method can be easily extended to any nonlinear oscillator without any difficulty. Moreover, the present work can be used as an illustration for many other applications in searching for periodic solutions of nonlinear oscillations and so can be found widely applicable in engineering and science.
